SE SitRep Team Status Tracker

Preliminary Research

I looked at three widely used team collaboration tools to understand what already exists and where the gaps are for a dedicated team status tracker like SE SitRep.

Slack:

Slack has a `/status` command that lets you set a short status like In a meeting or Working from home but it is just a text label it does not log anything or notify your team lead. There are standup bots like Geekbot that post check-in prompts in a channel but the responses are just messages they get buried after a few hours and there is no dashboard to see who responded and who did not. For our project, we want structured check-ins with a visible team overview, not just chat messages.

- Has: `/status` command, standup bots via third-party integrations, channel messaging
- Missing: no check-in history, no blocker flagging, no team overview dashboard, updates disappear

Asana:

Asana has a (My Tasks) section where each member sees their assigned tasks and due dates, and a project board where leads can see all tasks by status (To Do, In Progress, Done). It also has a status update feature on projects where a lead can manually post a weekly summary. However, there is no daily check-in prompt members have to proactively open Asana and update their tasks. Nobody is reminded to check in, and there is no place to say I am blocked or I am overwhelmed outside of leaving a comment on a task.

- Has: task boards, due dates, project status updates, assignee tracking
- Missing: no daily check-in, no automatic reminders, no mood or blocker signal, updates are task-level not person-level

Notion:

Notion lets you build a custom standup table using its database feature columns for name, date, what you did, what you are doing, and blockers our team could set one up manually. The issue is nothing prompts you to fill it in. There are no notifications no reminders and no way for a lead to see at a glance who has updated today versus who has not. Every entry requires the user to manually open Notion, find the table, and add a new row. In practice, people forget and the table goes stale after a few days.

- Has: customizable database tables, kanban views, shareable pages
- Missing: no reminders, no automatic status detection, no real-time dashboard, high maintenance burden

Key Takeaways:

- wellbeing signals are completely missing across all three
- Slack is where people already are so SE SitRep should integrate with it rather than replace it
- Asana and Notion are too heavy for a quick daily check-in we need something much simpler

- A dedicated check-in tool that takes under 60 seconds and surfaces results automatically fills a real gap
-

User Story:

As a busy CS student who keeps forgetting to check in, I want to get a quick reminder and complete my check-in in under a minute, so that my team always knows I'm on track without me having to remember to update them.

Acceptance Criteria

- I get a Slack reminder if I haven't checked in by a set time
 - The check-in is only 2-3 short fields nothing more
 - Once submitted, my update shows up instantly on the team dashboard
-

User Persona

Mena Malik - The Overcommitted Student Developer

Age: 21

Role: CS senior, fullstack developer on a class project team

Schedule: Fragmented classes, part-time internship, and project work

Works: Mostly async, late evenings after other responsibilities

Tools she uses: GitHub, VS Code, Slack, Notion

Bio:

Mena is a 21-year-old CS senior on a 5-person class team. She's technically strong but busy she usually works in short windows late at night. She cares about the project but worries her teammates don't realize she's contributing because she's rarely available during the day.

Goals:

- Log her daily progress quickly without it eating into work time
- See what teammates are working on so she can pick up tasks without waiting for a meeting
- Signal when she's overwhelmed or blocked without it feeling like a big deal

Frustrations:

- Slack status updates get buried she posts one, nobody sees it, she stops posting
- Asana shows task status but not whether a teammate is struggling or needs help
- Can't always attend stand-ups due to schedule conflicts misses important context

- No easy way to signal I'm having a rough week without sending a long awkward message

Quote :

"I did 3 hours of work at midnight and nobody knows. I just need a simple way to say: I'm here, I'm moving, I'm okay."

Note on GenAI use: I used Claude AI to help me narrow down which 3 tools to research. There are a lot of existing tools in this space and since I wanted to focus on ones I was already somewhat familiar with I asked Claude to help identify the most relevant and commonly used options for small software teams

Wireframe

What problem are we actually solving?

1. **Status awareness** : what is each person doing right now / today
2. **Blocker surfacing** : who's stuck and does anyone know it
3. **Wellbeing & coverage** : are we burning out, who can step in
4. **Scheduling** : when can we actually meet

Must-have (core)

1. Daily check-in form (fast, under 1 minute)
2. Team dashboard (see everyone's status)
3. Blocker tracking (who is stuck)
4. Mood / wellbeing signal (am I okay?)
5. Login / signup

Can be added later

6. Reminders (Slack or email)
7. AI summary of team's day
8. Meeting scheduler (when can we meet?)
9. Task statuses (todo / in progress / done)
10. Real-time availability (online / offline)

Screens you need to design (wireframes)

Based on the features above, I think you need **5 main screens** for MVP:

1. **Login / Signup screen**
2. **Daily check-in form** (where you write your update)
3. **Team dashboard** (the main page — see everyone)
4. **Blockers page** (list of all blockers)
5. **Personal profile / settings** (your account)

Maybe also:

- **Team setup** (create team, add members)

The AI-agents angle:

Agents as team members — if Claude Code or a Copilot agent is opening PRs, closing issues, or writing tests overnight, should the standup show "Agent-1 completed 3 tasks while you slept"? Treating agents as first-class teammates with their own status feed is a clean concept.

We can pick this.

Agents as observers — an AI summarizes the team's actual GitHub/Slack activity and drafts a standup for each person to confirm or edit. Less "tracking the agent" and more "agent doing the tracking."

Agents as facilitators — AI notices patterns ("Sara has flagged blockers 3 days in a row, nobody's responded") and nudges.
