

Preliminary research:

Daily Bot - [link](#)

Treat AI agents as “contributors” with different rules:

- Human owner delegates work to an agent.
- Agent status appears under that owner.
- Agents can have states like “running,” “needs review,” “opened PR,” “failed tests,” or “blocked.”

Takeaways:

- tracker should not replace team conversation completely. It should make the routine status part asynchronous, then help the team identify which topics actually need live discussion.
- GitHub Projects can track issues, pull requests, ideas, custom fields, board/table/roadmap views, filtering, sorting, grouping, and charts.
- Core Features
 - Daily standup Markdown log
 - Sprint summary Markdown
 - Blocker list linked to GitHub Issues
 - Retrospective action items
 - Team participation report

User Story:

Story: Daily team check-in with blocker visibility

As a student team lead, I want each team member to submit a short daily check-in with current work, next steps, blockers, mood/capacity, and linked GitHub issue or PR, so that the team can quickly see who has checked in, who needs help, and what should be discussed during standup or saved as GitHub process evidence.

User Persona:

Persona: Yu, Project Team Lead

Age : College age

Role: Team lead

Team context: 8-12 person software team

Tools: GitHub Issues, GitHub Projects, Slack, GitHub Actions, Markdown docs

Experience level: Comfortable with GitHub and web development, but still learning how to run a disciplined Agile process

Goals:

Yu wants the team to stay aligned without spending too much time in meetings. She needs to know who checked in, what everyone is working on, which GitHub issues are active, and what blockers need help before they become sprint risks. The course requires process evidence in GitHub, so she also wants the tracker to make documentation easier instead of adding another chore.

Frustration:

Yu's biggest frustration is that team status is scattered across Slack messages, GitHub Issues, PRs, meeting notes, and people's memory. This matches Atlassian's 2025 team research finding that teams can waste significant time searching for answers, even when they technically have more information than ever (<https://www.atlassian.com/blog/state-of-teams-2025>). He also worries that standups can become repetitive status meetings instead of useful blocker-resolution sessions.

Needs:

A tool that

- Reminds teammates to check in.
- Shows missing check-ins.
- Highlights blockers and low capacity.
- Links updates to GitHub Issues/PRs.
- Produces Markdown summaries for the repo.
- Tracks AI-agent work without losing human accountability.
