

Project Research - Frontend

Frontend tools we could use:

- React (UI)
- JavaScript or TypeScript
- Tailwind (style)

For frontend tools, I'm thinking we can use React since it handles reusable components like update cards, blockers, and mood indicators for each member. We can use JavaScript or if we want to enhance safety and maintainability, we could use TypeScript but it may slow down workflow.

User Story

As a frontend developer, I want to be able to quickly and easily submit my daily update and see my team's status so I can stay up to date on what other members are working on, any blockers, and how we are progressing as a team.

User Persona

Bio: Olivia is a recent graduate who just started her role primarily as a frontend developer at a small startup her friend created about a year ago.

Lifestyle: She usually works from 8am-5pm, but her schedule can be a bit irregular and sometimes if she does happen to fall a bit behind, she stays later to finish up her work and stay on top of it.

Goals:

- Wants to stay up to date on and on top of the scheduling, tasks, and meetings.
- Wants to frequently communicate with supervisor(s) and other members on current tasks, and balance flexibility.
- Wants to be able to learn from her more experienced team members, and to help or give if she has anything helpful/valuable to offer.

Frustrations:

- Sometimes it would help to have even more communication with team, especially if schedules become more scattered or individual work is not all aligned.
- Updating status and progress more punctually and prompt more often.
